

# Sound Analysis Part 2

**Step 10**

**Step 11**

**Step 12**

# of meals per day  
= # of prominent peaks

**Step 15**

**Step 14**

**Step 13**

Step 10: Peck count was counted for entire day in a farm, with the microphone attached to the feeder

Step 11 : In this step, the number of pecks was converted to weight (grams) of food fed

Step 12: We find the peaks in the graph

Step 13: Peak prominence was calculated for each peak

Step 14: Peaks were considered significant if the peak prominence was greater than a threshold

Step 15: Number of meals per day is considered to be equal to number of significant peaks in the graph between Feeding weight (in gm) Vs Time of the day.
